

Why does battery temperature vary during charging and discharging process?

During charging and discharging process, battery temperature varies due to internal heat generation, calling for analysis of battery heat generation rate. The generated heat consists of Joule heat and reaction heat, and both are affected by various factors, including temperature, battery aging effect, state of charge (SOC), and operation current.

How does charge/discharge rate affect battery heat generation?

(32) Huang found that the larger the charge/discharge rate is, the more the heat generation is. (33) Wang investigated lithium titanate batteries and found that the heat generation rate of aged batteries is higher than that of fresh batteries, and the heat generation is greater than that during charging. (34)

How much heat does a battery generate?

The results show that for the state of charge, the dissipated heat energy to the ambient by natural convection, via the battery surface, is about 90% of the heat energy generation. 10% of the energy heat generation is accumulated by the battery during the charging/discharging processes.

Why is operating temperature of lithium-ion battery important?

Operating temperature of lithium-ion battery is an important factor influencing the performance of electric vehicles. During charging and discharging process, battery temperature varies due to internal heat generation, calling for analysis of battery heat generation rate.

How does temperature affect a battery?

As the heat production of the battery continues to increase, the internal temperature gradually increases, and the heat produced during the constant current charging process tends to be stable.

Does battery temperature increase with heat generation?

They obtained that the battery maximum temperature increases with heat generation and with the decrease of Reynolds number and conductivity ratio. They found that thermal oils, nanofluids and liquid metals provide the same maximum temperature range.
