

What are the components of a capacitive power supply?

Full-wave bridge rectifier circuit. Voltage regulator circuit. Power indicator circuit. A capacitive power supply has a voltage dropping capacitor (C1), this is the main component in the circuit. It is used to drop the mains voltage to lower voltage. The dropping capacitor is non-polarized so, it can be connected to any side in the circuit.

What type of power supply uses a capacitive reactance?

This type of power supply uses the capacitive reactance of a capacitor to reduce the mains voltage to a lower voltage to power the electronics circuit. The circuit is a combination of a voltage dropping circuit, a full-wave bridge rectifier circuit, a voltage regulator circuit, and a power indicator circuit.

Why are capacitors important in the design of power supplies?

This article emphasizes the importance of capacitors and their capacitive properties and topologies in the designs of power supplies. Designs based on capacitive topologies are particularly suitable for power supplies in the milliwatt range. They are simple, compact and economical.

What is a capacitor used for?

Out of all of the fundamental passive electronic components, capacitors are arguably the most abundantly used. In fact, it is hard to find a circuit board that does not have a capacitor on it and a circuit that does not use a capacitor. Capacitors play key roles in the design of filters, amplifiers, power supplies and many additional circuits.

Where are electrolytic capacitors found?

These capacitors can be found in many power electronics and in circuits with high amounts of power consumption. One example where electrolytics offer an advantage is the reservoir capacitor in power supplies. Figure 3. Meanwell power supply with multiple types of capacitors

How many circuits are there in a capacitive power supply?

$Z = \sqrt{R^2 + X^2}$ Schematic of capacitive power supply circuit shown below. The working principle of the capacitive power supply is simple. From the Capacitive power supply circuit diagram we can observe the circuit is a combination of four different circuits. Voltage dropping circuit. Full-wave bridge rectifier circuit. Voltage regulator circuit.
