

What is the operational life of an aluminum electrolytic capacitor?

The operational lifetime of an aluminum electrolytic capacitor is directly related to temperature. This brief presents a simplified method of calculating a capacitor's operational life based on temperature and operating voltage.

What is the relationship between capacitor lifespan and operating temperature?

The relationship between capacitor lifespan and operating temperature follows Arrhenius' Law of Chemical Activity, which says that lifespan of a capacitor doubles for every 10°C decrease in the temperature. Below are the formulas for capacitor lifespan calculations for different type of capacitors.

How do you calculate the operating life of a capacitor?

Indeed, this operating life is obtained using regression (the least square fitting method) equations characterizing the temporal variations of the capacitance C and of the ESR as a function of temperature. And from the Arrhenius equation for a fixed temperature of the capacitor, the total lifetime can be deduced.

How to predict the life of an electrolytic capacitor?

It is a new method which predicts the life of an electrolytic capacitor by estimating the ESR and the ripple current flowing through the capacitor using temperature and current as a constraint. A life model employing core temperature estimation derived from ESR deterioration and operating conditions is shown.

Does the operating voltage affect Radial electrolytic capacitor lifetime?

Please contact Jianghai Europe for approval. For Radial Electrolytic Capacitors, this part of the formula has no impact ($KV = 1$). But for some bigger capacitors like Snap-In and Screw-Terminal types with rated voltages above 160V, the operating voltage will affect their Lifetime.

How do you calculate the lifetime of a non-solid aluminum electrolytic capacitor?

Equations (17) through (19) can be used for estimating the lifetime of a non-solid aluminum electrolytic capacitor based on the ambient temperature, the rise of internal temperature due to ripple current, and operating voltage applied. $L_x = L_o \cdot 2^{T_o - T_x / 10}$; $2 - T_5$ (17)
