

All-vanadium liquid flow batteries are toxic

How important is safety advice for a vanadium flow battery?

As the global installed energy capacity of vanadium flow battery systems increases, it becomes increasingly important to have tailored standards offering specific safety advice.

What is a vanadium redox flow battery (VRFB)?

The vanadium redox flow battery (VRFB) has gone from being a laboratory curiosity, to gaining significant commercial application over the last decades. To date over a hundred systems have been installed worldwide, for stationary energy supply. Redox flow batteries store energy chemically in positive and negative electrolytes.

What are the disadvantages of all-vanadium flow batteries?

Among them, the all-vanadium flow battery is the most technologically mature flow battery, but vanadium metal salts are expensive and toxic, which hinders further commercialization of VRFBs. And the low OCV of 1.26 V also restricts the improvement of energy density.

Are redox flow batteries toxic?

However, the main redox flow batteries like iron-chromium or all-vanadium flow batteries have the dilemma of low voltage and toxic active elements. In this study, a green Eu-Ce acidic aqueous liquid flow battery with high voltage and non-toxic characteristics is reported. The Eu-Ce RFB has an ultrahigh single cell voltage of 1.96 V.

Are lithium based batteries safe?

Many thousands of articles published on lithium-based batteries have considered some aspect of safety. In contrast very little has been reported on electrical safety of the VRFB, or other types of flow battery. This is partly because they are intended for stationary applications, which are often unmanned.

Is EU-CE acidic aqueous liquid flow battery toxic?

In this study, a green Eu-Ce acidic aqueous liquid flow battery with high voltage and non-toxic characteristics is reported. The Eu-Ce RFB has an ultrahigh single cell voltage of 1.96 V. The high concentration of electrolyte enables the full-cell energy density to reach 43 Wh/L.
