Beside this, η is related to the parameters of super-capacitor and battery, including inter-resistance as well as capacitance, etc. Obviously, η increases as the duty cycle ratio D descends. In this case, when D equals 0, η will reach its maximal value: $\eta = (R_b + R_s) / R_s$. According to the formula, the peak output power of super-capacitor and ...

A standard alkaline AA battery holds about 2.8 amp-hours. That means that a AA battery can produce 2.8 amps for an hour at 1.5 volts (about 4.2 watt-hours -- a AA battery can light a 4-watt bulb for a little more than an hour). Let's call it 1 volt to make the math easier. To store one AA battery's energy in a capacitor, you

A supercapacitor is a newer concept that combines the design of a battery with the physics of a capacitor. A capacitor has two layers of conductive material with an insulator (like, for example ...
