## **SOLAR** PRO. Battery capacity test system design

#### What is battery capacity testing?

Also known as load testing, or discharge testing, capacity testing is a dynamic test whereby a simulated load (in amperes or watts) is imposed on the battery system for a specified time. The discharge continues to a defined end-of-discharge (EOD) voltage, referencing a measured battery temperature taken at the start of the test.

#### What are IEEE recommended practices relating to battery capacity testing?

The Institute of Electrical and Electronics Engineers (IEEE) recommended practices relating to capacity testing of lead-acid and nickel-cadmium batteries are the same documents that provide information relating to maintenance.

#### Is there a substitute for capacity testing?

There is no substitute. What is capacity testing? Also known as load testing, or discharge testing, capacity testing is a dynamic test whereby a simulated load (in amperes or watts) is imposed on the battery system for a specified time.

What are the fundamentals of battery testing?

Key fundamentals of battery testing include understanding key terms such as state of charge (SOC); the battery management system (BMS) which has important functions including communication, safety and protection; and battery cycling (charge and discharge) which is the core of most tests.

Which battery testing solution is best?

For the most commonly used battery testing system in the market is the separation solution, which is a mature solution. This application report introduces an integration battery testing solution which is simpler than the separation solution in the design.

What is capacity testing & why is it important?

Capacity testing is part of a successful and complete maintenance program, so it stands to reason that testing practices are covered in these documents. Of course, the battery's manufacturer can be consulted about testing processes and regimes; most support the IEEE recommended practices, guides and standards.

Poor pack design or poor battery management system (BMS) design can also result in some cells being overcharged. Overcharging is the most dangerous electrical abuse ...

The old battery had cells that were around 4800mAh each so (4800mAh x  $4 = 19,200 \times 3.85V = 73920mAh$ ) which is around the stated design capacity of the battery. LiPo cells are nominal 3.7V so even with the new cells I should get the calculated capacity: 5600mAh x  $4 = 22,400mAh \times 3.7V = 82,880mAh$  design capacity. I tested each individual cell and ...
