

What are the different methods of charging a battery?

There are two main methods of charging a battery: Constant current method. In this charging method the batteries are charged at a constant current. The charging current is set by introducing some resistance in the Circuit. This method has its own drawbacks because the state of charge Of the battery is not taken into account.

How do you charge a battery?

Charging batteries is simple (in theory) - put a voltage across the terminals and the battery charges. If safe charging, fast charging and/or maximum battery life are important, that's when things get complicated.

How complex is a battery charging system?

The complexity (and cost) of the charging system is primarily dependent on the type of battery and the recharge time. This chapter will present charging methods, end-of-charge-detection techniques, and charger circuits for use with Nickel-Cadmium (Ni-Cd), Nickel Metal-Hydride (Ni-MH), and Lithium-Ion (Li-Ion) batteries.

How do I charge a lithium ion battery?

When charging a lithium-ion battery, the charger uses a specific charging algorithm for lithium-ion batteries to maximise their performance. Select LI-ION using the MODE button.

What is a small current charging method?

A method of continuously charging the battery with a small current. Its name derives from the trickle of water. Although the charging time is longer, the advantage is that the battery is not affected even if a small current continues to flow in a fully charged state.

What types of batteries can be charged using MCC Method?

The MCC method is suitable for charging the following battery types: lead-acid, NiMH, and Li-ion batteries. With equal initial current values, the MCC charging process takes a bit more time compared to the CC-CV charging method.
