

What is a high voltage battery?

The High Voltage system associated with a group of cells strung together in series and/or parallel. The electrical design of the battery pack is associated with fundamental electrical elements.

What factors affect the design of a high-voltage battery system?

In addition, different types of electric vehicles have different requirements that greatly affect the design of a high-voltage (HV) battery system, including its internal components. Next to interior components, also size and shape requirements of components from cell module, mechanics, cooling, or electronics need to be adapted adequately.

What is the hvbms reference design for battery-internal communication?

For battery-internal communication, the HVBMS reference design offers two possible architectures: isolated electrical transport protocol link (ETPL) or CAN/CAN FD. The CMU board features four of our latest ASIL D compliant battery cell controllers (BCC), together monitoring and balancing up to 56 cells.

What is the electrical design of a battery pack?

The electrical design of the battery pack is associated with fundamental electrical elements. These elements are: Busbars, Contactors, Fuses, pre-charge resistors, current sensors, HV (High Voltage) and LV (Low Voltage) Connectors, and wiring harnesses. This will cover: For all of these components we need to consider:

What is a high voltage battery optimization tool (HV-bot)?

2. High-Voltage Battery Optimization Tool (HV-BOT) The High-Voltage-Battery-Optimization-Tool (HV-BOT) is a software tool for optimizing HV battery systems within (hybrid) electric vehicles. The tool's main application is the optimization of battery system concepts given user-defined requirements.

What is a high voltage EV?

EVs are typically operated at high voltages U_{system} of 400 V - 800 V in order to avoid exceeding component protection limitations within the application and to minimize ohmic losses. System voltage results from the number of serially connected cells n_{serial} within the system and the cell chemistry-dependent voltage U_{cell} .

This rating drives the design and cost. Typically 650V devices are used in 400V nominal system designs. 1200V devices are used in 800V nominal systems. The 900V devices are reasonably new to the market and ...
