

Can electrodeposition be used to extract metals from recycled battery components?

Because electrodeposition is a very efficient and selective method, it can also be used to extract metals such as lithium, cobalt, nickel, and other valuable materials from recycled battery components.

Is selective electrodeposition a promising method for battery recycling?

Overall, this study suggested that selective electrodeposition is a promising efficient separation method for battery recycling that facilitates the direct recovery of cobalt and nickel from used NMC cathodes, as well as potential future material-processing applications through morphological control and structuring.

How to recycle lithium battery materials based on deactivation mechanism?

Based on the deactivation mechanism of lithium battery materials, the recycling process can be categorized into four main aspects: i. Separation of positive electrode materials and aluminum foil during pre-treatment; ii. Molten salt-assisted calcination for recycling positive electrode materials; iii.

Are there systematic reviews on electrochemical recycling methods for batteries?

There are several comprehensive reviews on electrochemical recycling methods for batteries; however, there are systematic reviews that focus on comparing and developing different methods for the specific recycling of spent LIBs are lacking.

What is pyrometallurgical recovery technology for lithium batteries?

The continuous progress in pyrometallurgical recovery technology for lithium batteries enables the efficient and environmentally friendly extraction of valuable metals, carbon, and direct regeneration of lithium battery cathode materials from waste lithium battery materials.

Is dry electrode processing a viable method for developing advanced electrodes?

The satisfactory achievements obtained from dry electrode processing stimulate this technique to be more competitive in developing advanced electrodes (Ludwig et al., 2017). Further exploring advanced dry coating methods toward large-scale electrode production is imperative considering their economic and environmental superiority.

Recycling of battery materials (such as electrodes) has been expected to save 13 % of the Lithium-ion batteries cost per kilowatt-hour. However, presently only <3 % of LIBs are recycled universally. The metals used in the cathodic active layer are more costly, it covers 90 % of the overall value, and is one of the critical catalysts for LIBs recycling.

They combined the positive electrodes in Li/MoO<sub>2</sub> and Li/WO<sub>2</sub> cells as negative electrodes in their lithium-ion cells consisting of LiCoO<sub>2</sub> and MoO<sub>2</sub> (or WO<sub>2</sub>) although they did not call it lithium-ion battery.

Their idea made good sense. The low voltage of the  $\text{WO}_2$  and  $\text{MoO}_2$  made them relatively useless as positive electrodes in lithium metal ...

Fast-charging, non-aqueous lithium-based batteries are desired for practical applications. In this regard,  $\text{LiMn}_2\text{O}_4$  is considered an appealing positive electrode active material because of its ...

Electrochemical battery recycling uses electrochemical processes to recover valuable materials, particularly metals, from depleted batteries. 69 This method involves disassembling the battery components and leveraging electrochemical reactions to segregate and recover the target materials. 70 Owing to its efficiency and eco-friendliness, electrochemical ...

This study explores a novel solvent-based delamination method that employs a mixture of triethyl phosphate (TEP), acetone, and carbon dioxide ( $\text{CO}_2$ ) under pressure and ...

2 ???&#0183; High-throughput electrode processing is needed to meet lithium-ion battery market demand. This Review discusses the benefits and drawbacks of advanced electrode processing methods, including ...

In this Review, we outline each step in the electrode processing of lithium-ion batteries from materials to cell assembly, summarize the recent progress in individual steps, deconvolute the interplays between those ...

Lithium-containing eutectic molten salts are employed to compensate for the lithium in spent lithium battery cathode materials, remove impurities, restore the cathode ...

Characterizing Li-ion battery (LIB) materials by X-ray photoelectron spectroscopy (XPS) poses challenges for sample preparation. This holds especially true for assessing the electronic structure of both the bulk and interphase of positive electrode materials, which involves sample extraction from a battery test cell, sample preparation, and mounting. ...

Lithium-ion batteries (LIBs) have emerged as the dominant energy solutions for electronic devices and electric vehicles (EVs) due to their favorable characteristics, such as high energy density, high power density, cycling stability, and cost-effectiveness [[1], [2], [3]]. With the projected production of LIBs, the global energy market is expected to reach a value of 250 ...

Lithium-containing multi-element transition metal oxide primary particles are combined together by the second phase material to form the secondary particle of the lithium-ion battery positive...

Two types of solid solution are known in the cathode material of the lithium-ion battery. One type is that two end members are electroactive, such as  $\text{LiCo}_x\text{Ni}_{1-x}\text{O}_2$ , which is a solid solution composed of  $\text{LiCoO}_2$  and  $\text{LiNiO}_2$ . The other ...

Effect of Layered, Spinel, and Olivine-Based Positive Electrode Materials on Rechargeable Lithium-Ion Batteries: A Review November 2023 Journal of Computational Mechanics Power System and Control ...

A battery unit comprises a cathode, anode, and electrolyte, which involves mass and energy transport via faradic reactions. In these, cathode materials include a high weight of electrode materials and the cost of a battery component. The demand for cathode source materials has grown by 50-74 % in 2040 [21], [22]. Therefore, many researchers ...

In this study, the use of PEDOT:PSSTFSI as an effective binder and conductive additive, replacing PVDF and carbon black used in conventional electrode for Li-ion battery application, was demonstrated using commercial carbon-coated  $\text{LiFe}_{0.4}\text{Mn}_{0.6}\text{PO}_4$  as positive electrode material. With its superior electrical and ionic conductivity, the complex ...

Reducing particle size is a widely accepted method to shorten ion diffusion path. 3D electrode material is also a good choice of morphology to increase the active site and promote ion transport; (iii) Design of pore structure is an effective modification method, which can expose more active sites and accelerate reaction kinetics.
