SOLAR PRO. Battery shell repair principle

What is the role of battery shell in a lithium ion battery?

Among all cell components, the battery shell plays a key role to provide the mechanical integrity of the lithium-ion battery upon external mechanical loading. In the present study, target battery shells are extracted from commercially available 18,650 NCA (Nickel Cobalt Aluminum Oxide)/graphite cells.

Why are battery shells important?

Generally, battery shells serve as the protective layerfor LIBs to withstand external mechanical loading and sustain the integrity of electrochemical functioning environment.

What is the material phase of battery shell?

XRD pattern illustrates that the material phase of the battery shell is mainly Fe,Ni and Fe-Ni alloy(Fig. 1 e). The surface of the steel shell has been coated with a thin layer of nickel (Ni) to improve the corrosion resistance, which is also demonstrated by cross-sectional image observation (Fig. S5a).

How to choose a battery shell material?

Traditionally, high strengthis the priority concern to select battery shell material; however, it is discovered that short-circuit is easier to trigger covered by shell with higher strength. Thus, for battery safety reason, it is not always wise to choose high strength material as shell.

Why is Lib shell important for battery safety?

Conclusions LIB shell serves as the protective layer to sustain the external mechanical loading and provide an intact electrochemical reaction environment for battery charging/discharging. Our rationale was to identify the significant role of the dynamic mechanical property of battery shell material for the battery safety.

Does nickel plated steel make a good battery shell?

The choice of nickel plated steel on its strength is critical. This study provides a solid dynamic constitutive modeling methodology for the LIB shell and the strain rate sensitive which may stimulate further study towards the safety design and evaluation of battery cells and packs.

Here, cycling effect is not considered, for the maximum strain of the battery shell during cycling is 0.35% [28] which is in elastic stage and is recoverable, i.e., cycling of the battery does not affect mechanical performance of battery shell. All the tests were conducted at the room temperature since batteries usually work at 30-40 °C during electric vehicle operations.

When a lithium battery is placed in a low-temperature environment, the microstructure of the lithium film on the surface of the lithium battery and the electrolyte, as well as their interface, ...
