How long does a capacitor take to charge and discharge?

This charging (storage) and discharging (release) of a capacitors energy is never instant but takes a certain amount of time to occur with the time taken for the capacitor to charge or discharge to within a certain percentage of its maximum supply value being known as its Time Constant (  $\tau$  ).

How long does it take a resistor to charge a capacitor?

If a resistor is connected in series with the capacitor forming an RC circuit,the capacitor will charge up gradually through the resistor until the voltage across it reaches that of the supply voltage. The time required for the capacitor to be fully charge is equivalent to about 5 time constants or  $5T$ .

Can a capacitor be charged instant?

The charging of a capacitor is not instantas capacitors have i-v characteristics which depend on time and if a circuit contains both a resistor (R) and a capacitor (C) it will form an RC charging circuit with characteristics that change exponentially over time.

How many time constants does a capacitor have?

After a period equivalent to 4 time constants, (  $4T$  ) the capacitor in this RC charging circuit is said to be virtually fully charged as the voltage developed across the capacitors plates has now reached 98% of its maximum value,  $0.98V_s$ . The time period taken for the capacitor to reach this  $4T$  point is known as the Transient Period.

What happens when a capacitor is fully charged?

As charges build up on the capacitor,the electric field of the charges on the capacitor completely cancels the electric field of the EMF source,ending the current flow. Capacitor becomes an open circuitwith all the voltage  $V$  of the source dropping across the capcitor. We say that the capacitor is fully charged,with charge  $Q = CV$ .  
 $Q = C V$ .

How do you calculate the charge on a capacitor?

We have seen here that the charge on a capacitor is given by the expression:  $Q = CV$ ,where  $C$  is its fixed capacitance value,and  $V$  is the applied voltage.

To charge a capacitor we make the circuit shown in Figure 37.5 with a constant EMF source. In the diagram, a capacitor of capacitance ( $C$ ) is in series with an EMF source of voltage ( $V$ ) The resistance ( $R$ ) is the total resistance ...
