# **SOLAR** PRO. Capacitor lead cutting method diagram

### How do I cut a component lead?

Note: Specially designed cutters are required when cutting component leads. Select the component lead that needs to be cut and place the cutter in position. (See Figure 3) Place the cutter at the midpoint in the lead and snip through to cut the lead.

## How do you lift a component lead?

Apply a soldering iron tip to the foot of the component lead. Apply slight force with the pickto lift the lead as the soldering iron reflows the joint. Figure 12: Visually inspect,or electrically test,to ensure that the lead has been lifted. Note: Specially designed cutters are required when cutting component leads.

## How do feedthrough capacitors work?

Feedthrough capacitors are used by making a mounting hole in the shielding case and soldering the ground electrode directly to the shielding case (plate). Since this type of capacitor has no residual inductance on the ground terminal side as well as on the signal terminal side, it can provide nearly ideal insertion loss characteristics.

How can a simple capacitor have high capacitance in a small volume?

A simple capacitor consists of a dielectric between two conductive materials. One way of having high capacitance in a small volume is to increase the dielectric-electrodes surface area in a given volume, which is done using different types of constructions, as listed in Table 1.

What is the structural model of a chip three-terminal capacitor?

The structural model of the chip three-terminal capacitor is shown above. An electrode pattern is printed on each dielectric sheet. Input and output terminals are provided on both ends and are connected using the electrode pattern.

### How does a dielectric capacitor work?

An electrode pattern is printed on each dielectric sheet. Input and output terminals are provided on both ends and are connected using the electrode pattern. This structure allows the signal current to pass through the capacitor. The residual inductance on the ground terminal is reduced with ground terminals on both sides.
