

How are lithium-ion battery prices calculated?

Lithium-ion battery costs are based on battery pack cost. Lithium prices are based on Lithium Carbonate Global Average by S&P Global. 2022 material prices are average prices between January and March. Technology cost trends and key material prices for lithium-ion batteries, 2017-2022 - Chart and data by the International Energy Agency.

How much does a lithium ion battery cost?

Currently, 54% of the cell price comes from the cathode, 18% from the anode, and 28% from other components. The average price of lithium-ion battery cells dropped from \$290 per kilowatt-hour in 2014 to \$103 in 2023. In the coming months, prices are expected to drop further due to oversupply from China.

How have lithium-ion battery prices changed over the last 10 years?

Lithium prices, for example, have plummeted nearly 90% since the late 2022 peak, leading to mine closures and impacting the price of lithium-ion batteries used in EVs. This graphic uses exclusive data from our partner Benchmark Mineral Intelligence to show the evolution of lithium-ion battery prices over the last 10 years.

How do lithium ion batteries work?

Lithium-ion batteries operate by collecting current and directing it into the battery during the charging process. Typically, a graphite anode attracts lithium ions and retains them as a charge. During discharge, the cathode draws the stored lithium ions and channels them to another current collector.

How does a lithium cathode work?

During discharge, the cathode draws the stored lithium ions and channels them to another current collector. The circuit functions effectively because the anode and cathode do not come into direct contact and are suspended in a medium that facilitates the easy flow of ions.
