Is capacitor current ramp compensation a good solution?

This paper intensively studies the proposed solution using capacitor current ramp compensation, which is a superior solution featuring fast response and universality. A frequency domain small signal model based on describing function method is proposed. The time domain large signal response to the load step change is analyzed.

How can a compensation resistor be used?

This can be achieved by several methods including a zero nulling resistor (RZ) or a voltage buffer in series with the compensation capacitor in the feedback path . A common-gate stage can also be employed to block the feed-forward component of the compensation current while achieving pole-splitting .

Does capacitor current ramp compensated V2 control have a transient response?

The time domain large signal response to the load step change is analyzed. The analysis illustrates the unique transient responsebehaviors of the capacitor current ramp compensated V 2 control. The design optimization methodology based on frequency domain and time domain analysis is presented.

How does a compensation capacitor work?

Here, the compensation capacitor is connected to an internal low impedance node in the first stage, which allows indirect feedback of the compensation current from the output node to the internal high-impedance node i.e. the output of the first stage. The dominant pole location for the indirect compensated op-amp is same as in Miller compensation.

Why does V control with small RC time constant capacitor have stability issue?

V control with small RC time constant capacitor has stability issue due to the insufficient capacitor current signal. ramp cannot always achieve desirable damping. The capacitor current ramp compensation for V contr ol provides desirable da mping to the loop while maintain ultra fast load transient response.

Are capacitor RC time constants small?

capacitors RC time constants are small. This paper intensively studies the proposed solution using capacitor current ramp compensation, which is a superior solution featuring fast response and universality. A frequency domain small signal model based on describing function method is proposed.

To address this issue, this letter proposes a compensation method, which eliminates the adverse impact by removing the time delay out of the capacitor-current loop. Consequently, the damping performance behaves as a constant positive resistance, and thereby the stable region of the damping gain is notably enlarged.

In order to minimize negative resistance behavior, reduce the time delay from the capacitor-current loop, and maintain system stability, the CCF damping method with ...
