What is the difference between air cooling and liquid cooling?

The temperature difference of the hottest cell between air cooling and liquid cooling reduces with an increase in power consumption. For the power consumption of 0.5 W, the average temperature of the hottest cell with the liquid cooling system is around 3 °C lower than the air cooling system.

Does power consumption affect temperature difference between air cooling and liquid cooling?

Effect of power consumption on the average temperature difference of the hottest cell between air cooling and liquid cooling.

Is liquid cooling more efficient than air cooling?

The liquid cooling system is more efficient than the air-cooling system within the investigated range of power consumption as it is capable of keeping the temperature lower than the air cooling method. Fig. 19. Average temperature increases in the hottest cell versus power consumption.

Which cooling system is the most energy consuming?

It was concluded that the air cooling system is the most energy-consuming method. Additionally, fin cooling is the heaviest cooling method considering the same volume for all kinds of cooling solutions.

What is the flow rate of liquid cooling system?

Air cooling and liquid cooling control equations In this study, the flow rate of 3 L/s to 21 L/s is considered for the air cooling, and the flow rate of 0.5 L/min to 3.5 L/min is investigated for the liquid cooling system.

How much power does a liquid cooling system consume?

For the power consumption of 0.5 W, the average temperature of the hottest cell with the liquid cooling system is around 3 °C lower than the air cooling system. For 13.5 °C increase in the average temperature of the hottest cell, the ratio of power consumption is around  $PR = 860$ .
