

What are the temperature characteristics of ceramic capacitors?

The temperature characteristics of ceramic capacitors are those in which the capacitance changes depending on the operating temperature, and the change is expressed as a temperature coefficient or a capacitance change rate. There are two main types of ceramic capacitors, and the temperature characteristics differ depending on the type. 1.

What is the temperature coefficient of a capacitor?

Generally the temperature coefficient is expressed in the units of parts per million per degree centigrade (PPM/°C) or as a percent change with a particular range of temperatures. Some capacitors are linear (class 1 capacitors), these are highly stable with temperatures; such capacitors have a zero temperature coefficient.

What is the maximum operating temperature of a capacitor?

*2 Maximum operating temperature: By design, maximum ambient temperature including self-heating 20°C MAX that allows continuous use of capacitors. The EIA standard specifies various capacitance temperature factors ranging from 0 ppm/°C to -750 ppm/°C. Figure 1 below shows typical temperature characteristics.

How does temperature affect the capacitance of a capacitor?

The capacitance value of a capacitor varies with the changes in temperature which is surrounded the capacitor. Because the changes in temperature, causes to change in the properties of the dielectric. Working Temperature is the temperature of a capacitor which operates with nominal voltage ratings.

What is a temperature compensating ceramic capacitor?

1. Temperature-compensating-type multilayer ceramic capacitors (Class 1 in the official standards) This type uses a calcium zirconate-based dielectric material whose capacitance varies almost linearly with temperature. The slope to that temperature is called the temperature coefficient, and the value is expressed in 1/1,000,000 per 1°C (ppm/°C).

What temperature does a capacitor work?

Generally, most capacitors work well between -30°C to +125°C. Nominal voltage ratings for a working temperature for plastic capacitor types are no more than +70°C. Electrolytic capacitors and aluminium electrolytic capacitors are susceptible to deformation at high temperatures because of leaking and internal pressure.
