

Thus, if a double-sided contact passivation scheme is to be considered, the results in this work suggest that it is preferable to implement a solar cell structure with a textured front surface and a planar rear surface, and adopting the electronselective passivated contacts at the textured front surface and the hole-selective passivated contacts at the planar rear surface, as will be shown ...

TOPCon solar cells (SCs) with double-sided electrodes have recently reached a new record efficiency of 26% by Fraunhofer ISE [4], revealing the application potential of poly-Si passivating contacts for high-efficiency c-Si solar cells. Besides, such a technology is compatible with the Passivated Emitter Rear Cell (PERC) production line, and the upgrade from PERC to ...

The majority of monolithic perovskite/Si tandem solar cells (TSCs) have been built on heterojunction (HJT) Si solar cells, which have seen limited industrial uptake due to manufacturing cost and concern over the viability of metal electrodes and transparent conductive oxides (TCOs) incorporating expensive elements. Recently, researchers from The Australian ...

A stack of heavily doped polycrystalline silicon (poly -Si) and tunnel SiO₂ contact has attracted much attention, benefitting from its excellent characteristics of carrier ...

The champion efficiencies of n/p-type solar cells based on the TOPCon concept have been boosted to 25.8% and 26.1%, respectively, outperforming the conventional passivated emitter and rear contact ... The 200 μm -thick, $\langle 100 \rangle$ -oriented, double-sided polished n-type Czochralski (CZ) Si wafers with a resistivity of $\sim 5 \, \Omega \cdot \text{cm}$ were used to prepare ...

Advanced passivation contact in high-efficiency silicon solar cells plays an important role for the sake of minimizing recombination losses. A stack of heavily doped polycrystalline silicon (poly-Si) and tunnel SiO₂ contact has attracted much attention, benefitting from its excellent characteristics of carrier selectivity and passivation, and which has been ...

The double-sided TOPCon solar cells present a very high J_{sc} over 39 mA/cm² (Figure 2) for such structure with a front shadowing grid. ... software leads to the enhancement of the efficiency of ...

The stability in open circuit voltage of interdigitated backside buried contact (IBBC) and double sided buried contact (DSBC) solar cells formed on n-type Si in comparison ...

Potential process flow for a silicon solar cell adopting double-sided passivated contacts and bifacial metal contacts. ... of 18.3 and 20.6% for both n-type silicon and p-type silicon solar cells ...

Double-sided, front and rear, tunnel oxide passivated contact (TOPCon) of crystalline silicon (c-Si) solar cells on textured wafer is presented. The double-sided TOPCon structure is composed of (p) poly-Si/SiO_x/(n) c-Si/SiO_x/(n) poly-Si, where the silicon oxide (SiO_x) layer is formed by atomic layer deposition (ALD). With a 0.6 ± 0.1 nm-thick SiO_x layer, an ...

Keywords: passivated contacts, contact passivation, silicon solar cells, double-sided passivated contacts 1. **Introduction** To meet the future energy needs, there is a need to develop low-cost alternative ... (4 cm²) float-zone n-type silicon wafer, adopting a conventional front-side selective emitter, photolithography processes, and evaporated ...

[Show full abstract] Q. ANTUM cells, narrowing the gap to the highest-efficiency module technologies which use n-type silicon solar cells, at an extremely competitive manufacturing cost. In ...

The rear emitter double-side TOPCon solar cell is selected as the bottom cell in tandem solar cells, where a p⁺-poly-Si/SiO_x forms the rear emitter and an n⁺-poly-Si/SiO_x forms the front field ...

In this article, detailed numerical modeling is performed for front junction (FJ) and rear junction (RJ) n-type Si solar cells with screen-printed double-side poly-Si based tunnel oxide passivated contacts (TOPCon). A roadmap for efficiency projections of commercial-type RJ and FJ topologies reaching 24.8% and 23.3% efficiencies, respectively, has been developed to quantify and ...

This has been quantified by numerical simulation (using SunSolve (TM)) and also solved experimentally, i.e., processing ultrathin 3-/10-nm hole/electron extracting SiO ...

When the contact resistivity of the front-side localized n-type polysilicon contact reaches 0.002 Ω·cm² with a saturation current density of ~10 fA/cm² in the front-side un-diffused area, the efficiency of the rear-junction n-type solar cell is expected to be ~26%, showing its potential for application in mass-production of high-efficiency crystalline silicon solar cells.
