

In scenario 2, energy storage power station profitability through peak-to-valley price differential arbitrage. The energy storage plant in Scenario 3 is profitable by providing ancillary services and arbitrage of the peak-to-valley price difference. The cost-benefit analysis and estimates for individual scenarios are presented in Table 1.

The second feature of this study is that the design, simulation, and construction of the system were based on the actual needs of the standard; after communication with the staff of the oil production plant, design of this system had three basic objectives: the first is to use the most mature and safe technology and equipment, while also considering various safety factors ...

The ongoing energy transition is leading to a substantial increase in the installed capacity of Renewable Energy Sources (RESs) (Hansen, Breyer, & Lund, 2019) Germany, for example, the installed capacity has more than doubled from 56,545 MW in 2010 to 125,386 MW at the end of 2019 (IRENA, 2020) total, RESs supplied almost 43 percent of Germany's ...

Among all the schemes, the refrigeration-ice storage system had the lowest energy consumption (CO₂ emissions) and cooling cost. Compared with absorption refrigeration, absorption refrigeration-ice storage decreased energy consumption (CO₂ emissions) by 8.31 %, operating costs by 27.41 % and life cycle cost by 32.35 %. This is because ...
