

What is dry dust removal technology?

Dry dust removal technology mainly uses electrostatic precipitator equipment, which ionizes the converter flue gas at high voltages.

Can high-temperature dust removal and denitration solve catalyst problems in coal-fired power plants?

A new integrated technology of high-temperature dust removal and denitration, which solves the catalyst problems of wear, blockage, and poisoning caused by the operation of selective catalytic reduction (SCR) denitration systems in coal-fired power plants under high concentrations of particulate matter, is developed.

Does Pyrometallurgical treatment of dust reduce recycling feasibility?

The yield of crude Zn oxide from the pyrometallurgical treatment of dust is low (Dutra et al.,2006,Ruiz et al.,2007),which greatly reduces its recycling feasibility (Lobato et al.,2015).

How to integrate high-temperature dust removal and denitration?

New technologies and equipment for the integration of high-temperature dust removal and denitration have been developed in China. A new technology coupled deeply the high-temperature ultraclean electrostatic-fabric integrated precipitator (EFIP) and the low-dust denitration in one space.

Which Pyrometallurgical treatment methods are used in dust collection?

Regarding dust collection using dry dust removal technology, the most commonly used pyrometallurgical treatment methods include the Waelz process (Worrell and Reuter, 2014, Nakajima et al., 2008), FASTMET process (McClelland and Metius, 2003), and PRIMUS technology (Stoltz, 2010), among others.

What is dust to converter process?

The process can be used to directly recycle valuable secondary resources containing Fe, Zn, Ca, and Mg in dust to converter production so that the dust can be fully utilized, realizing an internal production cycle, achieving waste-free production, and reducing the economic cost of the iron and steel plant.

Metal-Organic Frameworks (MOFs) are versatile materials with tailorable structures, high surface areas, and controlled pore sizes, making them ideal for gas storage, separation, catalysis, and ...

298 Waste Disposal & Sustainable Energy (2022) 4:297-309 13 of organic wastewater, and the pollutants in the wastewater can be efficiently degraded [20- 22]. Spraying wastewater from sludge drying waste gas absorption treatment contains a variety of odorous substances, including nitrogen pollutants, sulfur pollutants and benzene series [23].

The on-site installation of standalone or hybrid renewable energy generators with energy storage could

provide the decarbonized power source for wastewater treatment ...

Download Citation | On Apr 1, 2023, Weiming Song and others published Dust removal ash coupled with high-temperature exhaust gas to produce energy gas CO and remove the heavy metals synchronously ...

Converter high-temperature flue gas (CHFG) is an important energy source, but it contains a low concentration of combustible gas and its use produces significant CO₂ emissions. We propose a method for increasing the combustible gas concentration of CHFG, which involves injecting dust-removal coke powder (DRCP) into CHFG and catalyzing their ...

Nitrogen removal in wastewater treatment has been studied and implemented in full-scale plants, ... 40% of the energy of the gas is assumed to be possible to convert to electricity ... wastewater is a popular stream since it is abundant and in this case is a catch-all term for industrial wastewater, food waste, landfill leachate, etc. Sludge and ...

Combined with the distinguishing features of converter dust and the advantages of the recently developed process, a new converter flue gas recycling (CFGR) process is ...

This study proposes a new process to produce high-quality combustible gas by spraying dust removal ash ... Exergy recovery from steelmaking off-gas by latent heat storage for methanol production. Energy (2006) E.R. Monazam et al. ... The average activation energy of waste tire decomposition was 144.51 kJ/mol. The increase in temperature and ...

In recent years, the application of BFD in wastewater treatment has attracted widespread attention. Based on the mechanisms of action of BFD in wastewater, this paper discusses in ...

It is further BAT to implement a waste water / waste gas management system (or waste water / waste gas assessment), as a subsystem to the EMS, using an appropriate combination of: on-site inventory and stream inventory on checking and identifying the most relevant emission sources for each medium and listing them according to their pollutant load

It provides a sustainable and affordable way to utilize WS waste resources to the fullest possible extent and can be very beneficial for the structural design and property ...

Coal-fired power generation is an important approach to supply energy [1]. And Coal-fired power stations supply over 70 % of the electricity in China [2]. However, large amounts of pollutants (e.g., particulate matter (PM), nitrogen oxides (NO_x), and sulfur oxides (SO_x)) are generated by combustion in coal-fired boilers. Thus, flue gas purification systems are installed ...

The global energy system is currently undergoing rapid transformation [1], and breakthroughs in renewable

energy and battery storage technology will accelerate the construction of a new power system dominated by green energy sources and promote the transformation of vehicle electrification, which will become an important way to achieve carbon ...

Increase in hard surface area, generation and mismanagement of wastewater, flooding, greenhouse gas emission, and many other factors are seriously destroying the ...

This Special Issue entitled "Advanced Technologies for Wastewater and Solid Waste Treatment" aims to attract high-quality scientific articles about wastewater and solid waste, discussing methods to reduce their quantities, but especially focusing on their treatment before being returned to the environment, to improve the preservation of the health of humans and ...

The mechanism of photo-oxygen catalytic waste gas treatment equipment is that the molecular structure of waste gas is cracked by high-energy and high-ozone ultraviolet (UV-UV) light beam, and the molecular chains of organic macromolecule compounds are broken and transformed into low-molecular inorganic compounds such as CO₂ and H₂ ...
