

# How much current does a 4 2 volt battery have

How much current does a 4 volt battery supply?

Two batteries connected in series feed a 0.16 Ohm resistor with 80 Watts of power at 3.85 Volts. Each 4 Volts battery is capable of supplying up to 20 Amps of continuous current. Ohm's Law calculation gives 22.36 Amps of current draw for the entire circuit but ... Question 1: How much current is drawn from each battery ?

What is a 4.2V battery?

In contrast, the 4.2V variant typically represents the maximum voltage the battery can reach when fully charged. These voltage ratings determine these batteries' compatible devices and applications. Understanding the characteristics of 18650 lithium batteries is crucial for selecting the right type of battery.

What is the difference between 4.2V and 3.7V battery?

Higher voltage in the 4.2V battery typically increases power output. Devices utilizing this variant often exhibit enhanced performance and efficiency, especially in applications demanding higher energy delivery. The 3.7V battery, with its lower nominal voltage, caters to devices requiring a moderate power supply.

What is a 3.7 volt battery?

3.7V is the rated voltage of the lithium battery, and its upper limit voltage for charging is 4.2V, also known as the limit voltage. In the case of the same size and capacity, a battery with nominal voltage of 3.7V is the same as a battery with a limit voltage of 4.2V, so the former can be used instead of the latter.

Can I charge a 3.7V lithium-ion battery with an 4.2V Charger?

Yes, you could charge your 3.7V lithium-ion battery with a 4.2V charger. When using the charger to charge the battery, the output voltage of the charger should match (ie equal) the maximum voltage of the battery. If the output voltage of the charger is higher than the maximum voltage of the battery, the battery may be damaged.

What voltage should a 3.7V lithium-ion battery be charged at?

It would be best if you'd charge your 3.7V lithium-ion battery at 4.2V as its ideal full charging voltage is 4.2V. In addition, it should be noted that a 3.7V lithium-ion battery should be charged using a 4.2V constant voltage charging mode.
