SOLAR PRO. How much does the energy storage charging pile liquid cooling system cost

How does a charging pile work?

At present, the charging piles popular in the industry use air-cooled heat dissipation modules. They use a high-speed fan to exhaust the air powerfully. The air is sucked in from the front panel and discharged from the rear of the module, thereby taking away the heat from the radiator and heating components.

Why should you use a liquid-cooling charging system?

The high protection levelof the liquid-cooling charging system makes the system widely used in high-dust mining sites, high-temperature, high-humidity, high-salt fog, and typhoon-prone seaside; Scenarios with explosion-proof requirements such as gas stations and underground mines.

How to maintain the air-cooling charging system?

Easy maintenance: The traditional air-cooling charging system needs to regularly clean or replace the filter of the pile body, regularly remove dust from the pile body fan, remove dust from the module fan, replace the module fan or clean the dust inside the module.

How long does an energy storage system last?

The 2020 Cost and Performance Assessment analyzed energy storage systems from 2 to 10 hours. The 2022 Cost and Performance Assessment analyzes storage system at additional 24- and 100-hour durations.

How does liquid energy storage work?

Liquid Air Energy Storage (LAES) applies electricity to cool air until it liquefies, then stores the liquid air in a tank.

What are the advantages of liquid-cooling charging system ur100040-lq & ur100060-lq?

It can be seen that the liquid-cooling charging system can perfectly solve the problems of low reliability and high noise of the traditional charging system. The liquid-cooling charging modules UR100040-LQ and UR100060-LQ exhibited adopt a hydropower split design, which is convenient for system design and maintenance.
