Why do we use capacitors in distribution networks?

Decreasing the total network loss is often the main reason for using capacitors in distribution networks. Capacitor placement approach involves the identification of location for capacitor placement and the size of the capacitor to be installed at the identified location.

How do capacitors affect voltage levels across a distribution network?

The placement of capacitors resulted in improved voltage levels across the distribution network. Voltage deviations from the nominal value were significantly reduced. There was a notable reduction in active power losses ( $I^2R$  losses) throughout the distribution lines.

How shunt capacitors are used in distribution networks?

For compensating reactive power, shunt capacitors are often installed in electrical distribution networks. Consequently, in such systems, power loss reduces, voltage profile improves and feeder capacity releases. However, finding optimal size and location of capacitors in distribution networks is a complex combinatorial optimisation problem.

Can a capacitor bank be optimally placed in a distribution system?

The feasibility and effectiveness of the proposed algorithm for optimal placement and sizing of capacitor banks in distribution systems, with the definition of a suitable control pattern, have been proved. How does capacitor bank integration affect a distribution system?

Distribution systems commonly face issues such as high power losses and poor voltage profiles, primarily due to low power factors resulting in increased current and additional active power losses. This article focuses on assessing the static effects of capacitor bank integration in distribution systems.

How do you connect a capacitor to a transmission line?

**Shunt Capacitor Connection** This is the most common method of connection. . The capacitor is connected in parallel to the unit. The voltage rating of the capacitor is usually the same as or a little higher than the system voltage. There are other methods as well that are very useful in order to improve the power factor of transmission lines.
