Can calcium-looping be used to store concentrated solar energy?

The use of Calcium-Looping for storage of concentrated solar energy is studied. Diverse power cycles coupled to the Calcium-Looping process are analysed. High solar plant efficiency can be achieved using a closed carbon dioxide Brayton cycle.

#### What are power cycles?

Power cycles are used in all thermal energy plants--including coal,natural gas,and nuclear energy plants--to convert heat into electricity. Concentrating solar-thermal power (CSP) plants are no different,but use sunlight to generate the heat to power a turbine.

Can integrated solar combined cycle systems improve power plant efficiency?

A number of integrated solar combined cycle (ISCC) systems have been proposed to improve the power plant efficiency.

What is a battery energy storage system (BESS)?

To overcome these challenges, battery energy storage systems (BESS) have become important means to complement wind and solar power generation and enhance the stability of the power system.

How are power cycles used in CSP thermal energy plants?

Power cycles are used in CSP thermal energy plants to convert heat into electricity using sunlight to generate the heat to power a turbine.

Can reversible carbonation/calcination be used for thermal energy storage?

Efficient, low-cost and environmentally friendly storage of thermal energy stands as a main challenge for large scale deployment of solar energy. This work explores the integration into concentrated solar power plants of the calcium looping process based upon the reversible carbonation/calcination of calcium oxide for thermochemical energy storage.
