SOLAR PRO. How to introduce capacitors to customers

What is a capacitor tutorial?

This tutorial is a deep dive into comprehensive knowledge of capacitors and will guide you through everything you need to know about them, all in one place. Capacitors are one of the most fundamental components we use for influencing the behavior of electric circuits.

How to select a capacitor?

In practice, a capacitor should be selected so that its working voltage is at least 50% greater than the highest effective voltage applied to it. Sometimes in capacitors AC voltage is also written on the capacitor. It refers to the RMS value and not the working voltage.

What is a capacitor used for?

Capacitors can be used for storing energy, conducting alternating current (AC), and blocking or separating direct current (DC). There are many types of capacitors out there that are differentiated by the materials used in construction, each providing certain benefit features which make it better for some applications.

What factors determine a capacitor's capacitance?

We can learn from Eq. (2.0.0) that the following three factors determine the value of the capacitance: Typically, capacitors have values in pF (picofarad) to microfarad (uF), the reason why we seldom see a capacitor marked as F (farad) is that because farad is a high value.

Why are capacitors important in electronic circuits?

In electronic circuits, attention is focused on semiconductors, but without passive components, semiconductors would not work. In particular, capacitors are indispensable partners for semiconductors that operate on direct current. This time, we have explained the basics of capacitors and their capacitance.

Why are capacitors important for a young circuit design engineer?

Capacitors are one of the most basic and important components in electronic circuits. For engineers who design circuits, accurate acquisition of knowledge about the characteristics and properties of capacitors is essential for product development. For young circuit design engineers, we present the "You Cannot Ask About Now.

This videos explains how to safely build a large scale capacitor using bin-bags, tin foil and an EHT power supply. This is a dangerous demonstration. Students must not touch the capacitor when it is connected to the power supply and great care must be taken to discharge properly. A very effective demonstration of the construction of the capacitor.
