

How to make a battery?

How to Make a Battery Step2. Cell Assembly - Battery LAB After the cathode and anode plates are produced in the electrode manufacturing process, the first step of making batteries, the next step is cell assembly. In the process, the four elements of secondary batteries including the separator and electrolyte are assembled together.

How do you assemble a battery?

The next step is assembling the battery cells. There are two primary methods: Winding: The anode and cathode foils, separated by a porous film, are wound into a jelly-roll configuration. Stacking: Stack the anode, separator, and cathode layers in a flat, layered structure. 4.2 Cell Enclosure

What is the assembly process of a battery?

While the electrode-making process is the same for all cylindrical, pouch, and prismatic types, the assembly process varies in the ways of stacking electrodes and inserting electrolyte as well as the order of sealing the batteries by each shape. Also, each battery maker employs different technology. There are two ways to stack electrodes.
