

How to measure the internal resistance of lithium batteries in parallel

What is internal resistance in a lithium ion battery?

Internal resistance (IR) is an important characteristic of a lithium-ion battery because it can greatly affect the performance of the battery. The IR of a battery represents the resistance to the flow of current within the battery, and as such, it can have a significant impact on the battery's ability to deliver power.

How do you measure the internal resistance of a battery?

Measuring the internal resistance of a battery is important to ensure that it is in good condition and to monitor its performance over time. The two most commonly used methods for measuring IR are EIS (Electrochemical Impedance Spectroscopy) and DC load testing.

How to calculate internal resistance of two battery cells in parallel?

When connecting two battery cells in parallel, you should be able to calculate the equivalent internal resistance using the formula $\frac{1}{R} = \frac{1}{r_1} + \frac{1}{r_2}$. This is because the total resistance is the sum of the individual resistances.

How to calculate the internal resistance of a battery cell?

We aim to calculate the internal resistance of the cell at approximately 47 % state of charge (SoC). Step 1. Calculate the discharge capacity of the battery cell for 47 % SoC. Since the nominal capacity of the battery cell is 3200 mAh, which corresponds to 100% SoC, at 47% SoC, the battery cell capacity would be: $0.47 \times 3200 = 1504 \text{ mAh}$? 1500 mAh

Should I measure the internal resistance of a fully charged battery?

It is generally recommended to measure the internal resistance of a fully charged battery to obtain accurate and consistent results. Measuring the internal resistance of a partially discharged battery may introduce variations due to the state of charge and can lead to misleading interpretations.

What if the internal resistance of a battery cell is not provided?

If the internal resistance of the battery cell is not provided by the manufacturer, as we'll see in this article, using the discharge characteristics of the battery cell, we can calculate the internal resistance of the battery cell, for a specific state of charge value.
