

Can hydrogen bonds improve the performance and stability of solar cells?

Furthermore, this review offers insights into the potential utilization of hydrogen bonds to further enhance the performance and stability of devices. In 2009, Tsutomu Miyasaka et al. prepared the first perovskite solar cell, which kicked off the research on perovskite light-absorbing materials.

What is a hydrogen bond in perovskite solar cells?

Hydrogen bond enables highly efficient and stable two-dimensional perovskite solar cells based on 4-pyridine-ethylamine. Rapid development in two-dimensional layered perovskite materials and their application in solar cells. One-Year stable perovskite solar cells by 2D/3D interface engineering.

Why are hydrogen bonds directional?

Why are Hydrogen Bonds Directional ?. Hydrogen-bond-bridged intermediate for perovskite solar cells with enhanced efficiency and stability. Orientated crystallization of FA-based perovskite via hydrogen-bonded polymer network for efficient and stable solar cells.

How does hydrogen bonding work in PSCs?

Hydrogen bonding can act as a double-edged sword in PSCs. On the one hand, hydrogen bonds can stabilize the perovskite materials by inhibiting the organic cation volatilities and ion migration, enhancing the charge transport, and inhibiting the charge recombination.

Are hydrogen-bonding spacers good for organic solar cells?

Provided by the Springer Nature SharedIt content-sharing initiative An article in Advanced Materials presents polymer donors with hydrogen-bonding spacers that enable intrinsically stretchable organic solar cells with a high power conversion efficiency and good stretchability.

Why are 2D perovskite solar cells more efficient and stable?

The high efficiency and good stability are attributed to the improved intermolecular interaction among PyEA molecules via hydrogen bond, which enables the charge transport between inorganic slabs in 2D perovskite. This work provides a new strategy to construct 2D perovskite for highly efficient and stable perovskite solar cells via hydrogen bond.
