What is the Fastmarkets battery Cost Index?

The Fastmarkets Battery Cost Index is an easy-to-use cost model for total cell costs, including cost breakdown of active anode material (AAM), cathode active material (CAM), separator, electrolyte, other materials, energy, labor and operational costs across multiple chemistries and geographies.

What is the battery Cost Index?

Understand costs to guide battery design and economics with Fastmarkets' Battery Cost Index, which gives you pricing granularity for existing battery materials. Find out more here.

What is a battery model?

The Model is, a user-friendly online tool that enables analysis, comparisons, and forecasts for battery production costs and performance by technology, company, location, and raw material prices for hundreds of different batteries, including next-generation cells.

Is the unit price of a battery cell based on factory size?

However, a high-volume market for all components of battery cells except cathode active material is assumed, meaning that the unit price of all components in a battery cell except cathode active material are independent of factory size. The latter approach is adopted in this work.

What factors affect the cost reduction of battery cells?

Within the historical period, cost reductions resulting from cathode active materials (CAMs) prices and enhancements in specific energy of battery cells are the most cost-reducing factors, whereas the scrap rate development mechanism is concluded to be the most influential factor in the following years.

How much does a Lib battery cost?

The average LiB cell cost for all battery types in their work stands approximately at 470 US\$.kWh⁻¹. A range of 305 to 460.9 US\$.kWh⁻¹ is reported for 2010 in other studies [75,100,101]. Moreover, the generic historical LiB cost trajectory is in good agreement with other works mentioned in Fig. 6, particularly, the Bloomberg report.
