

What is a lithium-metal battery?

Use the link below to share a full-text version of this article with your friends and colleagues. Lithium-metal batteries (LMBs) are representative of post-lithium-ion batteries with the great promise of increasing the energy density drastically by utilizing the low operating voltage and high specific capacity of metallic lithium.

What is a lithium metal battery (LMB)?

Lithium metal batteries (LMBs) has revived and attracted considerable attention due to its high volumetric (2046 mAh cm⁻³), gravimetric specific capacity (3862 mAh g⁻¹) and the lowest reduction potential (-3.04 V vs. SHE.).

Are lithium metal batteries a promising next-generation battery system?

Lithium metal batteries (LMBs) are regarded as a promising next-generation battery system with potentially high energy density (>300 Wh kg⁻¹), employing a lithium metal anode (LMA) that has a high theoretical capacity up to 3860 mAh g⁻¹ and redox potential as low as - 3.04 V vs. the standard hydrogen electrode [68-70].

What is a lithium ion battery?

Lithium-ion batteries are today the most frequently used rechargeable batteries and appear in laptops, cell phones, digital cameras and hybrid and electric vehicles. In general, they possess a low weight, high energy density and power density. The cell potential is usually in the range of 2.5-4.5 V.

When were lithium-metal batteries invented?

Origin year of lithium-metal batteries (LMBs) was assumed to be 1912 and in the 1970s it tested several materials as cathode [91,92]. Initially LIBs were manufactured in a cylinder coin type shape and light with a high specific energy and density. This development is focused further towards the advanced research for rechargeable LMBs.
