

In the run-up to disclose commercial products, both two-terminal and mechanically stacked four-terminal perovskite/silicon tandem solar cells have been recently ...

For a solar module with stacked cells, it is proposed to alternately arrange the solar cells in pin, nip, pin mode, etc., to structure the stack of solar cells in the form of strips and to carry out the wiring by structures d comb electrode which connects the sides p of the solar cells of a stack to the side n of the solar cells of the neighboring stack.

Copper indium diselenide ( $\text{CuInSe}_2$ ) is a promising candidate for solar cell applications because of its higher absorption coefficients ( $\sim 10^5 \text{ cm}^{-1}$ ) in the visible region, non-toxicity, and eco-friendliness (Regmi and Velumani, 2022).  $\text{CuInSe}_2$  (CIS) is a direct bandgap semiconductor with a bandgap of  $\sim 1.04 \text{ eV}$  makes it attractive in the TSC as the bottom sub ...

The filtered spectra have been used to investigate the performance of 2-T monolithically integrated and 4-T mechanically stacked TSCs. When measuring the short-circuit current density (JSC) in a 2 ...

This work presents a novel integrated solar cell with non-toxic copper indium disulfide ( $\text{CuInS}_2$ ) nanocrystals (NCs) and stacked polymer bulk heterojunction. This parallel ...

Silicon (Si) based solar cells have dominated the terrestrial solar panel market with an average panel power conversion efficiency (PCE) of around 20% [2], while the record cell efficiency stands just above 26% [3], which is very close to the Shockley-Queisser (S-Q) limit of single-junction solar cells (29% for silicon) [4]. It is upfront that the efficiencies beyond the S-Q ...

In this paper, a novel self-complementary shaped multiple- L slot loaded suspended microstrip patch antenna stacked with a polycrystalline silicon (poly-Si) solar cell is presented for 2.4/5.2 GHz band WLAN and 2.5/3.3/5.8 GHz band WiMAX networks. While the proposed self-complementary shaped multiple-L slot loaded suspended patch enables the propagation of ...

A SCAPS simulation investigation of non-toxic  $\text{MAGeI}_3$ -on-Si tandem solar device utilizing monolithically integrated (2-T) and mechanically stacked (4-T) configurations. ... Double-junction tandem solar cells containing a wide-bandgap top cell and a narrow-bandgap bottom cell have a great potential to outperform current single-junction ...

Two-terminal (2-T) and four-terminal (4-T) tandem solar cells with wide bandgap perovskite ( $\text{MAPbI}_3$ ) as the top sub-cell and low bandgap copper indium diselenide ( $\text{CuInSe}_2$ , CIS) as the bottom sub ...

Placing solar cells on the radiation patch, feed network and ground surface of the antenna will cause serious current interference. Therefore, three integrations of solar cells are considered, as shown in Fig. 3. Specially, solar cells used in this design are from solar cell suppliers. The optimal load resistor is 30.77  $\Omega$  under standard ...

An, H. Wang, and Y. Luo (2021), In this work, a dual-band single port antenna is proposed, integrated with solar cells, compatible with a 2.4/5 GHz WLAN. 30 solar cells were integrated into the ...

The upper W-Eg sub-cell is used to absorb high-energy photons, while low-energy photons in longer wavelength region are absorbed by the bottom N-Eg sub-cell. Tandem solar cells can be classified as 2-T monolithically integrated, 3-T tandem, 4-T mechanically stacked, and the spectral splitting systems [[8], [9], [10]] in terms of their ...

Single-junction solar cells are fundamentally limited to 33.7% efficiency, while double-junction tandems have a theoretical efficiency potential of 46.1%. ... Current density-voltage and quantum efficiency curves of monolithically integrated and mechanically stacked perovskite tandems. (a-b) Data for a monolithically integrated perovskite ...

H01L31/068 -- Semiconductor devices sensitive to infrared radiation, light, electromagnetic radiation of shorter wavelength or corpuscular radiation and specially adapted either for the ...

The power conversion efficiency of all-inorganic Sb<sub>2</sub>S<sub>3</sub>-on-Si two-terminal (2-T) monolithically integrated and four-terminal (4-T) mechanically stacked tandem solar cells are investigated. A one-dimensional solar cell capacitance simulator (SCAPS-1D) has been used to simulate the stand-alone antimony trisulfide (Sb<sub>2</sub>S<sub>3</sub>) top sub-cell, silicon (Si) bottom sub ...

In contrast, four-terminal (4T) tandem cells lack a standardized measurement protocol; their PCEs are typically presented as the sum of the PCEs of sub-cells measured separately, with the bottom cells receiving light passed through a simulated perovskite top cell stack [7], [24], [25], [26]. Additionally, there is often a size discrepancy in the reporting of 4T ...
