

Can a battery explode?

Physical damage to a battery can also lead to an explosion. This can occur if the battery is punctured, crushed, or otherwise physically compromised. Damage can cause a short circuit, leading to a rapid discharge of energy and a potential explosion.

Can heat cause a battery to explode?

Heat can indeed lead to battery explosion. When a battery is exposed to high temperatures, it can cause the internal components to undergo a chemical reaction that generates excess heat. This heat buildup can cause the battery to overheat, leading to a potential explosion.

What happens if a lithium battery explodes?
