Can You charge an EV in hot weather?

Generally charging your EV below 35°C (86 °F) shouldn't harm the battery. However, when the temperature is hotter, you should consider some steps to prevent battery degradation. Here's everything you should keep in mind about charging your EV in hot weather.

How does hot weather affect a car battery?

In hot weather conditions, the battery can degrade more quickly and reduce its overall lifespan. Excessive heat can also impact the performance of the battery, reducing the range of the car and increasing the time it takes to charge.

What temperature should a car battery be charged at?

In fact, they work best at temperatures of between 20 and 25°C. The risk of overheating the battery is increased during the summer when you drive at higher speeds on long journeys. Beyond 45-50°C, the battery's electronic components deteriorate more rapidly and a drop in charging performance is observed.

Does cold weather affect EV battery range?

As mentioned when we looked into the impact of cold weather on EV range, lithium-ion batteries don't take kindly to extreme temperatures. In fact, they work best at temperatures of between 20 and 25°C. The risk of overheating the battery is increased during the summer when you drive at higher speeds on long journeys.

Do electric cars perform better in hot weather?

Electric cars can perform worse in hot weather due to the following: battery degradation, too much use of air-conditioning, and tire wear because of hot road surfaces. Do electric cars overheat like gas-driven cars? Yes, but the cause can be different. For example, battery overheating or overcharging. The battery could explode and catch fire.
