Are alkaline aqueous nickel/iron batteries safe?

Alkaline aqueous nickel/iron batteries have been extensively research and have received much attention because of their high ionic conductivity, abundant reserves, non-toxicity, and safety. However, nickel-iron batteries often face electrode material oxidation, battery deactivation, and a high self-discharge rate of electrodes.

What is a nickel-iron (Ni-Fe) battery?

For more information on the journal statistics, click here. Multiple requests from the same IP address are counted as one view. The nickel-iron (Ni-Fe) battery is a century-old technology that fell out of favor compared to modern batteriessuch as lead-acid and lithium-ion batteries.

What is a nickel based battery?

These include nickel-cadmium, nickel-iron, nickel-hydrogen, nickel-metal hydride, and nickel zinc batteries. This type of nickel-based battery consists of a nickel (III) oxide-hydroxide material as the cathode, a cadmium plate as the anode, an alkaline electrolyte (usually potassium hydroxide) and a separator.

What are the different types of nickel based batteries?

Nickel-based batteries include various types, including nickel-cadmium (Ni-Cd), nickel-iron (Ni-Fe), nickel-zinc (Ni-Zn), and nickel-hydrogen(Ni-H 2). In all of these nickel-based batteries, a nickel hydroxide electrode is used as the cathode.

What are nickel-iron batteries made of?

Nickel-iron batteries are resilient to overcharging and discharging along with high temperature and vibrations resistance. In these batteries, the electrolyte is made of potassium hydroxide, anode is made of iron and cathode is made of oxide-hydroxide.

Are alkaline rechargeable nickel-iron (Ni-Fe) batteries a good choice?
