Can phase change materials be used as thermal energy storage media?

Recently, Shalaby et al. presented a review on solar dryer system integrated with phase change materials as thermal energy storage media. They also presented the various techniques used for thermal conductivity enhancement of PCM such as, carbon fibers, expanded graphite, and graphite form.

What are organic phase change materials (O-PCMs)?

Journal portfolios in each of our subject areas. Links to Books and Digital Library content from across Sage. Organic phase change materials (O-PCMs) such as alkanes, fatty acids, and polyols have recently attracted enormous attention for thermal energy storage (TES) due to availability in a wide range of temperatures and high latent heat values.

What are phase change materials (PCM)?

Phase change materials (PCM) are one of the most effective and on-going fields of research in terms of energy storage. Especially, organic phase change materials (OPCM) has grabbed a lot of attention due to its excellent properties that can be combined with thermal energy storage systems to preserve renewable energy.

How encapsulated phase change material can improve thermal energy storage?

A suitable thermal energy management system can help to keep the energy stored in off peak season, which can be used during peak season when the demand is more. For this purpose, an encapsulated phase change material can be used to enhance the thermal energy storage in building walls, floor and ceiling.

What is a phase change material?

2. Phase change materials The PCMs are latent heat storage materials that have high heat of fusion, high thermal energy storage densities compared to sensible heat storage materials and absorb and release heat at a constant temperature when undergoing a phase change process (e.g. solid-liquid).

Thermophysical and thermochemical storages are the major classification of thermal storage media. Use of the thermophysical storage techniques in the form of phase change materials (PCM) for thermal energy storage (TES) is very cost effective and efficient as compared to the 2% efficiency of thermoelectric generators [5].
