What are the recent trends in electrode materials for Li-ion batteries?

This mini-review discusses the recent trends in electrode materials for Li-ion batteries. Elemental doping and coatings have modified many of the commonly used electrode materials, which are used either as anode or cathode materials. This has led to the high diffusivity of Li ions, ionic mobility and conductivity apart from specific capacity.

What is a positive electrode for a lithium ion battery?

Positive electrodes for Li-ion and lithium batteries (also termed "cathodes") have been under intense scrutiny since the advent of the Li-ion cell in 1991. This is especially true in the past decade.

Can lithium metal be used as a negative electrode?

Lithium metal was used as a negative electrode in LiClO_4 , LiBF_4 , LiBr , LiI , or LiAlCl_4 dissolved in organic solvents. Positive-electrode materials were found by trial-and-error investigations of organic and inorganic materials in the 1960s.

Is LiFePO_4 a good insertion material for lithium-ion batteries?

It is an ideal insertion material for long-life lithium-ion batteries, with about 175 mAh g^{-1} of rechargeable capacity and extremely flat operating voltage of 1.55 V versus lithium. LiFePO_4 in Fig. 3 (d) is thermally quite stable even when all of lithium ions are extracted from it.

What is a lithium ion battery?

Lithium-ion batteries consist of two lithium insertion materials, one for the negative electrode and a different one for the positive electrode in an electrochemical cell. Fig. 1 depicts the concept of cell operation in a simple manner. This combination of two lithium insertion materials gives the basic function of lithium-ion batteries.

Can lithium insertion materials be used as positive or negative electrodes?

It is not clear how one can provide the opportunity for new unique lithium insertion materials to work as positive or negative electrode in rechargeable batteries. Amatucci et al. proposed an asymmetric non-aqueous energy storage cell consisting of active carbon and $\text{Li}[\text{Li}_{1/3}\text{Ti}_{5/3}]\text{O}_4$.

The positive electrode base materials were research grade carbon coated C-LiFe_{0.3}Mn_{0.7}PO₄ (LFMP-1 and LFMP-2, Johnson Matthey Battery Materials Ltd.), LiMn_2O_4 (MTI Corporation), and commercial C-LiFePO₄ (P2, Johnson Matthey Battery Materials Ltd.). The negative electrode base material was C-FePO₄ prepared from C-LiFePO₄ as describe by ...
