

What causes non-uniform lithium plating in lithium ion batteries?

Manufacturing defects in the anode can induce non-uniform lithium plating, which significantly impacts the safety and cycle life of lithium-ion batteries. This study investigates the lithium plating mechanism induced by overhang failure defects, characterized by an anode that is 7 mm shorter than the cathode.

How do lithium ion batteries work?

LIBs operate through a variety of mechanisms due to the nature of the electrode materials and the electrochemical reactions involved. As shown in Figure 2, the lithium storage and release mechanisms in the electrodes are influenced by the type of redox electrochemical reactions at play.

Why is lithium plating ceased in a defective battery?

Lithium plating in defective batteries primarily occurs during the initial few cycles. Subsequently, the Coulombic efficiency of the defective battery increases, indicating that lithium plating has ceased. In this analysis, we aim to understand the reasons behind the cessation of lithium plating in the defect region.

What causes lithium ion batteries to fail?

2. Lithium-Ion Batteries Operating Principle The failure of lithium-ion batteries (LIBs) is primarily attributed to three main aspects: the nature of the materials used, the rigor in design and manufacturing, and finally, the influence of the operating environment.

How long does lithium stripping last in a battery?

During the charging process, lithium stripping persists in the time range from t_5 to t_6 . Lithium plating in defective batteries primarily occurs during the initial few cycles. Subsequently, the Coulombic efficiency of the defective battery increases, indicating that lithium plating has ceased.

Why does a lithium ion battery lose its cyclable capacity?

A typical lithium-ion battery loses its cyclable capacity during cycling and is limited in its useful life due to several levels of degradation processes, as described in Table 1 [20,21,22,23,24,25,26,27,28,29,30,31,32] and schematically depicted in Figure 1 b.
