Is energy storage a new regulatory resource?

As a new type of flexible regulatory resource with a bidirectional regulation function [3,4], energy storage (ES) has attracted more attention in participation in automatic generation control (AGC). It also has become essential to the future frequency regulation auxiliary service market [5].

What is the difference between regulation capacity clearing price and regulation mileage?

where  $L$  is the Lagrange function of the optimisation problem and is given in (43). The regulation capacity clearing price is the system incremental cost for procuring marginal regulation capacity and the regulation mileage clearing price is the system incremental cost for procuring marginal regulation mileage.

Is there a market model for energy and performance-based frequency regulation services?

This paper presents the mathematical formulation of a market model for energy and performance-based frequency regulation services. The charging and discharging schedules for fast-ramping energy storage units are taken into considerations. The relationship between market products and the components of market clearing prices are analysed.

How does a system operator calculate mileage based on regulation capacity?

Based on the submitted regulation capacity and mileage multipliers of each resource, the system operator ranks the resources in the descending order of mileage multipliers and calculates how much mileage can be obtained at most within the given regulation capacity requirement.

What is frequency regulation power optimization?

The frequency regulation power optimization framework for multiple resources is proposed. The cost, revenue, and performance indicators of hybrid energy storage during the regulation process are analyzed. The comprehensive efficiency evaluation system of energy storage by evaluating and weighing methods is established.

What is a system average mileage multiplier?

The system average mileage multipliers, indicating the ratio between the total regulation mileage provided and the total regulation capacity procured, are obtained from the historical regulation performance of the system [13, 14]. Resource-specific constraints: Resource-specific regulation capacity constraints:

The rapid growth of renewable generation in power systems imposes unprecedented challenges on maintaining power balance in real time. With the continuous decrease of thermal generation capacity, battery energy storage is expected to take part in frequency regulation service. However, accurately following the automatic generation control ...

The share of battery energy storage (BES) in the frequency regulation markets is increasing rapidly [1]. In the PJM market, the BES capacity has increased from zero in 2005 to over 280 ...

To ensure the economic feasibility of energy storage systems participating in frequency regulation services, the frequency regulation power demand ( $\tilde{P}_t$ ) at time  $t$  from energy storage can be represented by setting the desired probability ( $\alpha$ ) for energy storage to fulfill the frequency regulation signals (as shown in Fig. 2).

The indirect benefits of battery energy storage system (BESS) on the generation side participating in auxiliary service are hardly quantified in prior works.

regulation. Generally, fast-ramping energy storage units could provide larger regulation mileage per regulation capacity than conventional thermal units. In Fig. 1, regulation outputs of a battery energy storage system

As far as existing theoretical studies are concerned, studies on the single application of BESS in grid peak regulation [8] or frequency regulation [9] are relatively mature. The use of BESS to achieve energy balancing can reduce the peak-to-valley load difference and effectively relieve the peak regulation pressure of the grid [10].Lai et al. [11] proposed a ...
