

Are solar cells harmful to the environment?

Insufficient toxicity and environmental risk information currently exists. However, it is known that lead (PbI<sub>2</sub>), tin (SnI<sub>2</sub>), cadmium, silicon, and copper, which are major ingredients in solar cells, are harmful to the ecosystem and human health if discharged from broken products in landfills or after environmental disasters.

Can solar cells be made from organic waste?

Closely related to the fabrication of solar cells from organic waste is the fabrication of solar cells from agro-food and natural plants, including edible or useful fruits, plants, and flowers (Garcia et al. 2003; Elfi Susanti and Wicaksana 2019; Eop et al. 2019; Esakki and Sundar 2020).

Are solar cells toxic?

In other words, from an environmental point of view, insufficient toxicity and risk information exists for solar cells.

Can polymeric waste materials be used to make organic solar cells?

The characteristics of the Buriti oil and PS sample produced the best photovoltaic conversion parameters under the illumination of a UV-light lamp source and when illuminated under direct solar light. These results reveal the promising potential of polymeric waste materials in the fabrication of organic solar cells.
