

How do I calculate the capacity of a lithium-ion battery pack?

To calculate the capacity of a lithium-ion battery pack, follow these steps: Determine the Capacity of Individual Cells: Each 18650 cell has a specific capacity, usually between 2,500mAh (2.5Ah) and 3,500mAh (3.5Ah). Identify the Parallel Configuration: Count the number of cells connected in parallel.

What is a battery pack calculator?

This battery pack calculator is particularly suited for those who build or repair devices that run on lithium-ion batteries, including DIY and electronics enthusiasts. It has a library of some of the most popular battery cell types, but you can also change the parameters to suit any type of battery.

How to determine battery pack consistency?

First, the capacity of each cell in the battery pack  $Q_i$ , the difference in remaining chargeable capacity of each cell when the battery pack reaches the charge cutoff condition  $Q_{di}$ , and the internal resistance of each cell  $R_i$  are determined to accurately characterize the battery pack consistency.

What is a lithium-ion battery pack?

Lithium-ion batteries, particularly the 18650 battery pack design, have become the industry standard for many applications due to their high energy density and long lifespan. Understanding how to calculate a lithium-ion battery pack's capacity and runtime is essential for ensuring optimal performance and efficiency in devices and systems.

What is the difference between  $q_{pack}$  and  $Q_{CF}$ ?

As shown in Fig. 2,  $q_{pack}$  refers to the capacity of the battery pack, and  $Q_{cf}$  refers to the chargeable capacity.  $Q_l$  represents the capacity of series-connected batteries that cannot be discharged because they are limited by the lowest cell voltage, and  $Q_{unused}$  represents the capacity that is not used in real-world applications.

What is the purpose of evaluating battery pack consistency?

The final purpose of evaluating the battery pack consistency is to obtain its energy storage and power output capacity, that is, the maximum available energy  $E_{max}$  when the battery is fully charged and  $P_{max}$  at a specific SOC point.
