

What are reactive power compensation devices?

Such reactive power compensation devices are: The passive reactive power compensation includes the capacitor bank installation for reactive power injection. The active reactive power compensation consists of the use of flexible AC transmission system (FACTS) devices to change the reactive power and active power requirement.

Can a reactive power compensation device remove a short circuit fault?

However, after adding the dynamic reactive power compensation device SVC to the system, although the fault position was basically the same as above without the reactive power compensation device, the short circuit fault was removed.

How to optimize the performance of reactive power compensation devices?

The modal analysis method was used to find the optimal installation position for the reactive power compensation device. The improved particle swarm algorithm was used to optimize the capacity of the optimal reactive power compensation device to ensure the best performance of the compensation device.

What happens if there is no reactive power compensation device?

Program 1: In the case that there is no reactive power compensation device in either wind farm when the active power is about 385 MW, the busbar voltage drops rapidly and quickly reaches the limit instability point. Program 2: When the SC-type capacitor bank is put in, it leads to a large oscillation of the wind turbine terminal voltage.

Should a reactive power compensation device be added to a weak point?

Related scholars proposed that in the process of voltage static stability research, the corresponding reactive power compensation device should be added to the weak point of voltage, which can basically meet the requirements of wind power delivery in the Hami area to a certain extent.

How does reactive power compensation affect voltage support?

In summary, the voltage support ability of the above six reactive power compensation configuration programs is enhanced in turn. The minimum is when the active power of program 1 is about 385 MW, and the bus voltage drops rapidly. The maximum is when the active power output of program 6 reaches 610 MW, and the voltage instability finally occurs.

The influence of WFs on the voltage/reactive power of the power grid has become one of the main obstacles limiting the installed capacity of WFs, so it is urgent to carry out in-depth research on the optimal configuration method of multi-type reactive power compensation devices in power grid with a high proportion of WP [12 - 16].

As we know, a reactive power compensation device can be in operation for a long time (the lifespan of the device) once it is installed. Thus the installation cost of the device might be very small compared with the energy cost saving in the lifespan. ... In this paper, the sizing and allocation of a fixed capacitor as a reactive power ...

Installing flexible, reactive power compensation devices at the points of common coupling for new energy plants and within hybrid distribution grids can enhance power transmission capacity, ... The shorter the period, the more effective the capacitor balance. Given that the capacitor values of the submodules are identical, only the current ...

The active reactive power compensation consists of the use of flexible AC transmission system (FACTS) devices to change the reactive power and active power requirement.

FACTS devices are basically a combination of power system elements such as transformers, capacitors, and reactors with power semiconductor switching devices, which ...

NA series intelligent integrated harmonic suppression power capacitor compensation device is based on two (Δ-type) or one (Y-type) low-voltage power capacitors as the main body, using ...

MMECB is a smart solution for reactive compensation, configured either as a fixed or switched capacitor bank. Login. ... Smart solution for reactive power compensation configured either as a fixed or switched capacitor bank The MMECB combines primary components, and secondary control and protection, within a compact modular enclosure. ...

The passive reactive power compensation includes the capacitor bank installation for reactive power injection. Active Reactive Power Compensation The active reactive power compensation consists of the use of ...

The hardware structure of compensation device, reactive power compensation control mode, capacitor switching control method and capacitor output power regulation method are designed. Using Matlab/Simulink, the simulation results show that the proposed method can realize continuous reactive power adjustment according to the set power factor ...

Reactive compensation. UK design, manufacturing and maintenance. Fully enclosed solutions up to 33kV. 20 years experience in renewables and heavy industry. English; ...

The device described in this publication is a thyristor-switched capacitor (TSC) device used in a 200 kV/11 kV, 200 MW grid system. ... A modified reactive power compensation technique described by Das et al. makes use of a single-equivalent delta-connected thyristor-controlled reactor (TCR) and a mix of Y and Δ connected thyristor-switched ...

The most commonly used devices for reactive power compensation are shunt capacitor banks. Reactive power

compensation by means of shunt capacitors in the presence of voltage harmonics increases the harmonic distortions in the system. Capacitors are branches with low impedances at frequencies of higher harmonics and they can increase the level ...

However, the reactive power supplied by the generator and the high-voltage transmission line is far from meeting the needs of the load, so some reactive compensation devices should be set up in the power grid to supplement the reactive power to ensure the user's needs for reactive power, so that the electrical equipment can work under the rated voltage.

Moreover, reactive power compensation devices, such as capacitors and synchronous condensers, can mitigate these issues by injecting or absorbing reactive power to stabilize ...

1. Reactive power compensation can be achieved using passive devices like capacitors and reactors, or using FACTS devices which use thyristors to switch transmission line components in and out. 2. Common FACTS devices include ...

An automatic compensation method was presented based on adaptive capacitance regulation technology and the principle of controlling capacitor charging and discharging voltage. Based on the turn off ability of the self-turn off device, a switch circuit composed of two self-turning off devices connected in reverse parallel with diodes was connected in reverse parallel. Through ...
