

I found this video on YT that has a closeup of the person disconnecting the battery cable (link below) and reconnecting the battery. It looks like the connector sits on a row of pins, then you would slide the metal bar back to lock the connector ...

After driving a good distance the car was stopped and in park for about 10 minutes running when all of a sudden there was a burning smell. After that the battery light came on. We checked and couldn't find anything and the ...

Flex volt battery burnt out terminal I have a 6ah batter that showed full charge but when connected to any of my tools, they would not power up. I opened the case and found one of the connections had melted through . I was hoping someone ...

While using the bike recently, the connector (red+ black) cables started smoking and sparked, and then disconnected from the battery. I tried to reconnect the connector cables from the controller to the battery later, resulting in an ...

If you didn't plug the battery into a broken tool/deliberately short the pack then likely the pack has become faulty internally and that caused the dead short. Circa 100+ Amps required to do that, impressive!

Overlooking bad fusible link symptoms can severely affect your car's performance and can even lead to battery failure. The fusible link protects your car's components ...

The car, a 1991 Mitsubishi Galant, has been re-wired using a relay to get a electrical feed straight from the car battery to the fuel pump (to prevent voltage drop), and has been this way for at least five years. I have previously had a relay burn-out but thought at the time the relay was faulty. I am now thinking I may have a wiring issue ...

The barrel connector in the green plastic. It is burnt but not melted in any way. i I turn the key the 30 amp fuse blows. and in accesory you never get guages to even light. If i disconnect the barrel connector at the battery I can get the guages to light in the accesory mode but as soon as you turn the key to start it blows the fuse again?

I then removed the battery and connector again (with the plastic part still plugged onto the battery, and carefully placed a drop of superglue to the bottom of the detached connector. I then replaced the battery and

connector assembly onto the motherboard again, screwing in into place.

It is vitally important when repairing an overheated or burned out connector to inspect the entire affected area and replace all damaged parts. Since metal serves as an ...

My sur Ron power wire is soldered to my battery. The exterior of the connector looks fine but it won't budge. I'm fairly certain the red wire is the one that's stuck. Since I can't pull it apart, I intend to cut the wires and solder on an additional ...

The connection burned out on one of my batteries due to a loose fit after all the vibration. I was able to take the case apart and install new wires with an sae connector that stick out a hole I ...

The phone had been exposed to some seawater after the adhesives came apart, and caused a short circuit and burnt the connectors together (both board side and battery flex cable side). I believe that the vbat(?) and temp sense pads have been lifted off together with the burnt power connector component.

You have to replace the connector, part number is visible outside: 1J0 973 724. Remove the pins and wires from the old connector. Then replace the burnt wire by soldering a new piece of wire with the same diameter, use heat shrink to cover the soldered part, attach a new pin to the wire and put the pins back into the connector.

So the short answer is yes, you need to replace the reg/rec so that you get weatherproof connectors to replace the burnt plug, and also get rid of the stator plug and socket.
