# The battery interface is directly connected to the power supply

How does Windows use a battery management interface?

Windows uses this interface to get status information from the battery subsystem and to receive notifications of battery events. Windows features a robust battery and power subsystem device driver model. Power management information is conveyed to the Windows power manager through a battery device driver.

#### What is ACPI control method battery interface?

The battery power and charging subsystemin a Windows platform should implement the ACPI Control Method Battery interface. Windows uses this interface to get status information from the battery subsystem and to receive notifications of battery events. Windows features a robust battery and power subsystem device driver model.

#### How does a power supply work?

When you have a power supply, it needs to provide the correct voltage. If there is enough current it will run the computer. If there is more current available then the computer requires to run it will charge the battery with the excess, and if it's not enough, the battery will provide power to top up the difference.

Is the laptop battery interface standardized?

The battery interface is not standardized; each laptop manufacturer can implement its own proprietary interface. Aftermarket outfits have to reverse-engineer the interface. You can read about chips from STM,TI,Maxim,et cetera used in battery packs by searching for 'battery monitor ic'.

How does a laptop charger work?

When the laptop is plugged in, power is routed from the AC adapter to the system via the bypass path and also routed from the mains input to the battery via the charge controller. The charge controller will also monitor system power consumption so it can prevent overloading of the adapter.

#### How does a battery monitor communicate with a host?

The communication between the battery monitor and hostin a laptop typically uses a single wire (with ground) serial interface,most commonly based on I2C. What then are the communication protocols,standards etc. used in the charger <&gt; laptop &lt;&gt; battery that might help unpick this issue?

The battery pack literally charges itself. There is a MCU or battery monitor chip in the battery pack which monitors both the " external voltage" (which is actually the laptop's internal power supply regulated by the power circuitry) and the voltage on the cells. A pair of MOSFETs are used to control electricity both into and out of the cells.

Especially, the digital isolator requires an independent isolated power supply, which increases the cost and system complexity. In [2], the battery monitoring IC adopts a 4-wire, current-mode Serial Peripheral Interface (SPI) which allows the IC to be directly connected to one another without optocouplers or isolators. The ICs can be
