How does a solar cell work?

A solar cell (SC) comprises multiple thin layers of semiconductor materials. When sunlight shines on an SC, photons excite electrons in the semiconductor materials, generating an electric current. In recent years, there have been rapid advancements in SC research, primarily focused on improving efficiency and reducing costs.

What are solar cells based on?

Solar cells based on silicon now comprise more than 80% of the world's installed capacity and have a 90% market share. Due to their relatively high efficiency, they are the most commonly used cells. The first generation of photovoltaic cells includes materials based on thick crystalline layers composed of Si silicon.

Why are PV solar cells in high demand?

Photovoltaic (PV) solar cells are in high demand as they are environmental friendly, sustainable, and renewable sources of energy. The PV solar cells have great potential to dominate the energy sector. Therefore, a continuous development is required to improve their efficiency.

How was the first solar cell made?

After that, the solar cell was built by using gold thin film-coated selenium sheets. Moreover, the Bell Laboratory produced the first crystal PV cell in 1954, which had an efficiency of 4%, which means that only 4% of the solar energy was converted into electrical energy.

When did photovoltaic cells start?

It has now been 184 years since 1839 when Alexandre Edmond Becquerel observed the photovoltaic (PV) effect via an electrode in a conductive solution exposed to light. It is instructive to look at the history of PV cells since that time because there are lessons to be learned that can provide guidance for the future development of PV cells.
