

Why are lithium batteries so popular?

Among many systems, lithium metal batteries (Li batteries) emerge and draw enormous interest and attention because of the low electrochemical redox potential ( $-3.040\text{ V}$  vs normal hydrogen electrode, NHE) and high theoretical specific capacity ( $3860\text{ mAh g}^{-1}$ ) of lithium, which promises higher theoretical energy densities.

Why are Li-S batteries better than conventional lithium ion batteries?

Pure lithium metal comprises the anode, contributing to the high energy density. Abundant and inexpensive, sulfur can reduce battery production costs. Because Li-S batteries use less toxic materials than conventional lithium-ion batteries, they are considered more environmentally friendly. Here's a review of notable achievements in 2024.

What is a rechargeable lithium-sulfur battery?

Rechargeable lithium-sulfur (Li-S) batteries use sulfur as the cathode and lithium metal as the anode. Li-S batteries promise high theoretical energy density (up to  $2,600\text{ Wh/kg}$ ), significantly higher than conventional lithium-ion batteries (typically  $100\text{--}265\text{ Wh/kg}$ ). The Li-S battery's cathode uses sulfur mixed with carbon to improve conductivity.

What is the energy density of lithium ion batteries?

Energy density of batteries experienced significant boost thanks to the successful commercialization of lithium-ion batteries (LIB) in the 1990s. Energy densities of LIB increase at a rate less than 3% in the last 25 years. Practically, the energy densities of  $240\text{--}250\text{ Wh kg}^{-1}$  and  $550\text{--}600\text{ Wh L}^{-1}$  have been achieved for power batteries.

What is a Li-s battery?

Li-S batteries promise high theoretical energy density (up to  $2,600\text{ Wh/kg}$ ), significantly higher than conventional lithium-ion batteries (typically  $100\text{--}265\text{ Wh/kg}$ ). The Li-S battery's cathode uses sulfur mixed with carbon to improve conductivity. Pure lithium metal comprises the anode, contributing to the high energy density.

Who makes Li-S batteries?

China-based General New Energy has created a Li-S battery prototype with a  $700\text{ Wh/kg}$  energy density. Other companies developing Li-S battery technology include Sion Power, OXIS Energy, PolyPlus Battery Company, Sulfur8, Johnson Matthey, Samsung SDI, LG Chem, Morrow Batteries, and CATL.

Yes, there is. Lithium ion batteries work by the lithiation and delithiation of an anodic material through electrochemical processes. So far, the energy density is dictated by how well the anodic materials will alloy with Lithium. For example, when you charge a lithium ion battery with a graphitic anode, the graphite alloys with Lithium to form ...
