What is a lithium-metal battery?

Use the link below to share a full-text version of this article with your friends and colleagues. Lithium-metal batteries (LMBs) are representative of post-lithium-ion batteries with the great promise of increasing the energy density drastically by utilizing the low operating voltage and high specific capacity of metallic lithium.

What is a lithium metal battery (LMB)?

Lithium metal batteries (LMBs) has revived and attracted considerable attention due to its high volumetric (2046 mAh cm⁻³), gravimetric specific capacity (3862 mAh g⁻¹) and the lowest reduction potential (-3.04 V vs. SHE.).

Can lithium-metal batteries replace lithium-ion batteries in electric vehicles?

Despite extensive research, lithium-metal batteries have not yet replaced lithium-ion batteries in electric vehicles. The authors explore critical industry needs for advancing lithium-metal battery designs for electric vehicles and conclude with cell design recommendations.

Are lithium-metal batteries a viable alternative to lithium-ion batteries?

Nature Energy 9,1199-1205 (2024) Cite this article Lithium-metal battery (LMB) research and development has been ongoing for six decades across academia, industry and national laboratories. Despite this extensive effort, commercial LMBs have yet to displace, or offer a ready alternative to, lithium-ion batteries in electric vehicles (EVs).

Are lithium metal batteries the next generation of high-energy batteries?

Lithium metal batteries are among the most promising candidates of the next generation of high-energy batteries. They can store at least twice as much energy per unit of volume as the lithium-ion batteries that are in widespread use today.

How many cycles can a lithium ion battery achieve?

At a high area capacity of 5 mAh cm⁻², lithium metal anodes can also achieve stable dendrite-free cycles, and Li₄Ti₅O₁₂ batteries can also achieve 900 stable cycles. Meanwhile, Guo et al. placed lithium metal into a gold-containing (or silver-containing) solution, and prepared an inert metal layer through displacement reaction.
