

## Which port should the negative terminal of the battery be connected to

When connecting a battery a positive or negative terminal first?

Discerning the correct order between positive and negative first when connecting a battery can be confusing without a proper guide. So, here's the answer - connect the positive terminal first when connecting a battery before the negative terminal. The BIG QUESTION is - why connect the positive terminal first?

What is a positive terminal on a car battery?

These terminals are where you connect the cables when you're hooking up a new battery or jump-starting your car. The positive terminal usually has a plus sign (+) on it, and the negative terminal has a minus sign (-). You can find these terminals on top of the battery.

Why do I need a negative terminal on a car battery?

That is the BIG QUESTION. The reason behind this is the added security it offers during the connection process. You risk electric shock if you connect the negative terminal to the car's battery before the positive, since the spanner or wrench you're using to secure the positive line will come into touch with the car's metal components.

Which way should the positive and negative terminals be located?

When attaching a battery, it can be difficult to tell which way the positive and negative terminals should be located without a reference. The correct way to connect a battery is with the positive terminal connected first, followed by the negative terminal. Why is the positive terminal connected first? That is the BIG QUESTION.

What happens if you connect a battery to a wrong terminal?

Connecting the cables to the wrong terminals can cause sparks or even damage your car's electrical system. When you're connecting a battery, always start with the positive terminal. This means you'll connect the positive cable first. After that, connect the negative cable to the negative terminal.

Should you connect a positive terminal to a car battery?

Connecting the positive terminal first is safer when hooking up a car battery because it reduces the risk of short circuits. If you accidentally touch a tool or hand to the vehicle's frame while connecting the negative terminal, a spark can occur, potentially causing an explosion if hydrogen gas is present.

Several of us with these cars tow them 4 down behind our motorhomes. Battery has to be disconnected to tow. Some are removing the negative battery terminal at the firewall. ...
